

Data Security Platform for Healthcare:

Ensure compliance while protecting unstructured data from ransomware and insider threats

BrickStor SP eliminates the complexity of health care's top three data management challenges: data protection, compliance, and integrity.

Meet Electronic Health Records Requirements

Archive and Records Disposition – Maintain immutable copies and demonstrate when data has been purged or deleted.

Regulatory Compliance and Reporting – Generate automated reports to demonstrate compliance for audits, investigations, legal holds, and regulations.

Data Protection – End to end data integrity checks with automated snapshot and replication policies ensure your primary and secondary data copies are intact and protected.

Ransomware Protection

Data stored on the system is inherently secured with always-on protection policies. Immutable snapshots are protected from ransomware attacks and unintended changes. Identify compromised accounts, malicious behavior, and insider threats to prevent reinfection and further spread.

Zero Trust Data Security

Put protections as close to the data as possible. Track user behavior to identify insider threats. Defend and stop data breaches in real-time.

“**Data breaches** cost US healthcare organizations **\$13 billion in 2020**, impacting over 584K patients”

-InfoSecurity Magazine

Breaches have **exposed** over **230M** healthcare records equating to almost **70%** of the population of the United States.

-HIPAA Journal

A unified approach to data security enables you to reduce the cost and complexity traditionally associated with bolt-on security offerings.
